Deploy in Kubernetes Cluster

Team ID: PNT2022TMID28322

App deployment in Single Zone Cluster using LoadBalancer

Steps to deploy app directly using LoadBalancer

- 1. Create a single-zone IKS cluster using the IBM Cloud Console.
- 2. Download and apply Deployment and Service resource yaml, which will expose the echoserver application via the LoadBalancer service on specified port.
- 3. Check the IP address of the LoadBalancer service:

```
        $ kubectl get svc
        NAME
        TYPE
        CLUSTER-IP
        EXTERNAL-IP
        PORT(S)
        AGE

        iks-new-loadbalancer
        LoadBalancer
        172.21.183.148
        169.61.18.4
        1884:30923/TCP
        1m

        kubernetes
        ClusterIP
        172.21.0.1
        <none>
        443/TCP
        50d
```

Steps To Test The App 1. To test, load the specified IP port in

the

browser or initiate \$ curl http://169.61.18.4:1884

2. The following

response is

obtained:

```
Hostname: echoserver-deployment-859b75d8c4-r6s62
Pod Information:
        node name:
                        10.73.115.27
                        echoserver-deployment-859b75d8c4-r6s62
        pod name:
        pod namespace: default
        pod IP: 172.30.154.209
Server values:
        server_version=nginx: 1.13.3 - lua: 10008
Request Information:
        client address=195.21
        method=GET
        real path=/
        query=
        request_version=1.1
        request_scheme=http
        request_uri=http://169.61.18.4:8080/
Request Headers:
        accept=*/*
        host=169.61.18.4:1884
        user-agent=curl/7.54.0
Request Body:
        -no body in request-
```

Steps to deploy app directly using ALB/ Ingress Controller and Test it

- 1. Create a single-zone IBM Cloud Kubernetes Service cluster using the IBM Cloud Console.
- 2. Check if everything came up and the ALBs are running fine.
- 3. Download, edit, and apply the

Deployment and Ingress resource yaml, which will expose the echoserver application via the ALB/Ingress controller on both port 80(http) and 443(https)

4. To test, load the host you specified in your browser or initiate curl commands

```
Hostname: echoserver-deployment-859b75d8c4-d6fdx
Pod Information:
       node name: 10.73.115.19
       pod name: echoserver-deployment-859b75d8c4-d6fdx
       pod namespace: default
       pod IP: 172.30.116.132
Server values:
       server_version=nginx: 1.13.3 - lua: 10008
Request Information:
       client_address=172.30.119.129
       method=GET
       real path=/
       query=
       request_version=1.1
       request_scheme=http
       request_uri=http://echoserver.arpad-ipvs-test-aug14.us-south.containers.appdomain.cloud:8080/
Request Headers:
       accept=*/*
       host=echoserver.arpad-ipvs-test-aug14.us-south.containers.appdomain.cloud
       user-agent=curl/7.54.0
       x-forwarded-for=10.184.100.58
       x-forwarded-host=echoserver.arpad-ipvs-test-aug14.us-south.containers.appdomain.cloud
       x-forwarded-port=443
       x-forwarded-proto=https
       x-alobal-k8fdic-transaction-id=838e8708691877ea4ac7448370362e22
       x-real-ip=10.184.100.58
Request Body:
       -no body in request-
```

\$ curl https://echoserver.arpad-ipvs-test-aug14.us-south.containers.appdomain.cloud
